

CMU SCS

15-826: Multimedia Databases and Data Mining

Lecture#3: Primary key indexing – hashing
C. Faloutsos

CMU SCS

Reading Material

- [Litwin] Litwin, W., (1980), *Linear Hashing: A New Tool for File and Table Addressing*, VLDB, Montreal, Canada, 1980
- textbook, Chapter 3
- Ramakrishnan+Gehrke, Chapter 11

15-826 Copyright: C. Faloutsos (2017) 2

CMU SCS

Outline

Goal: ‘Find similar / interesting things’

- Intro to DB
- ➔ • Indexing - similarity search
- Data Mining

15-826 Copyright: C. Faloutsos (2017) 3

CMU SCS

Indexing - Detailed outline

- primary key indexing
 - B-trees and variants
 - ➔ – (static) hashing
 - extendible hashing
- secondary key indexing
- spatial access methods
- text
- ...

15-826 Copyright: C. Faloutsos (2017) 4

CMU SCS

(Static) Hashing

Problem: “*find EMP record with ssn=123*”
What if disk space was free, and time was at premium?

15-826 Copyright: C. Faloutsos (2017) 5

CMU SCS

Hashing

A: Brilliant idea: key-to-address transformation:

15-826 Copyright: C. Faloutsos (2017) 6

CMU SCS

Hashing

Since space is NOT free:

- use M , instead of 999,999,999 slots
- hash function: $h(key) = slot-id$

15-826 Copyright: C. Faloutsos (2017) 7

CMU SCS

Hashing

Typically: each hash bucket is a page, holding many records:

15-826 Copyright: C. Faloutsos (2017) 8

CMU SCS

Hashing - design decisions?

- eg., IRS, 200M tax returns, by SSN

15-826 Copyright: C. Faloutsos (2017) 9

CMU SCS

Indexing- overview

- B-trees
- (static) hashing
 - hashing functions
 - size of hash table
 - collision resolution
 - Hashing vs B-trees
 - Indices in SQL
- Extendible hashing

15-826 Copyright: C. Faloutsos (2017) 10

CMU SCS

Design decisions

- formula $h()$ for hashing function
- size of hash table M
- collision resolution method

15-826 Copyright: C. Faloutsos (2017) 11

CMU SCS

Design decisions

1) formula $h()$ for hashing function	Division hashing
2) size of hash table M	90% utilization
3) collision resolution method	Separate chaining

15-826 Copyright: C. Faloutsos (2017) 12

CMU SCS
SKIP

Design decisions - functions

- Goal: **uniform** spread of keys over hash buckets
- Popular choices:
 - Division hashing
 - Multiplication hashing

15-826 Copyright: C. Faloutsos (2017) 13

CMU SCS
SKIP

Division hashing

$$h(x) = (a * x + b) \bmod M$$

- eg., $h(ssn) = (ssn) \bmod 1,000$
 - gives the last three digits of ssn
- M : size of hash table - choose a prime number, defensively (why?)

15-826 Copyright: C. Faloutsos (2017) 14

CMU SCS
SKIP

Division hashing

- eg., $M=2$; hash on driver-license number (dln), where last digit is 'gender' (0/1 = M/F)
- in an army unit with predominantly male soldiers
- Thus: avoid cases where M and keys have common divisors - prime M guards against that!

15-826 Copyright: C. Faloutsos (2017) 15

CMU SCS
SKIP

Design decisions

- 1) formula $h()$ for hashing function
- ➔ 2) size of hash table M
- 3) collision resolution method

15-826 Copyright: C. Faloutsos (2017) 16

CMU SCSSKIP

Size of hash table

- eg., 50,000 employees, 10 employee-records / page
- Q: $M=??$ pages/buckets/slots

15-826 Copyright: C. Faloutsos (2017) 17

CMU SCSSKIP

Size of hash table

- eg., 50,000 employees, 10 employees/page
- Q: $M=??$ pages/buckets/slots
- A: utilization $\sim 90\%$ and
 - M : prime number

Eg., in our case: $M = \text{closest prime to } 50,000/10 / 0.9 = 5,555$

15-826 Copyright: C. Faloutsos (2017) 18

CMU SCSSKIP

Design decisions

- 1) formula $h()$ for hashing function
- 2) size of hash table M
- ➔ 3) collision resolution method

15-826 Copyright: C. Faloutsos (2017) 19

CMU SCSSKIP

Collision resolution

- Q: what is a 'collision' ?
- A: ??

15-826 Copyright: C. Faloutsos (2017) 20

CMU SCS

Collision resolution

CMU SCS

Design decisions - conclusions

- function: division hashing
 - $h(x) = (a * x + b) \bmod M$
- size M : ~90% util.; prime number.
- collision resolution: separate chaining
 - easier to implement (deletions!);
 - no danger of becoming full

15-826 Copyright: C. Faloutsos (2017) 28

 CMU SCS

Indexing- overview

- B-trees
- (static) hashing
 - hashing functions
 - size of hash table
 - collision resolution
 - ➔ – Hashing vs B-trees
 - Indices in SQL
- Extendible hashing

15-826 Copyright: C. Faloutsos (2017) 29

 CMU SCS

Hashing vs B-trees:

Hashing offers

- speed ! ($O(1)$ **avg.** search time)

..but:

15-826 Copyright: C. Faloutsos (2017) 30

 CMU SCS

Hashing vs B-trees:

..but B-trees give:

- key ordering:
 - **range queries**
 - **proximity queries**
 - **sequential scan**
- $O(\log(N))$ guarantees for search, ins./del.
- graceful growing/shrinking

15-826 Copyright: C. Faloutsos (2017) 31

 CMU SCS

Hashing vs B-trees:

thus:

- B-trees are implemented in most systems

footnotes:

- ‘dbm’ and ‘ndbm’ of UNIX: offer one or both

15-826 Copyright: C. Faloutsos (2017) 32

CMU SCS

Indexing- overview

- B-trees
- (static) hashing
 - hashing functions
 - size of hash table
 - collision resolution
 - Hashing vs B-trees
- ➔ – Indices in SQL
- Extendible hashing

15-826 Copyright: C. Faloutsos (2017) 33

CMU SCS

Indexing in SQL

- create index **<index-name>** on **<relation-name>** (**<attribute-list>**)
- create unique index **<index-name>** on **<relation-name>** (**<attribute-list>**)
- drop index **<index-name>**

15-826 Copyright: C. Faloutsos (2017) 34

CMU SCS

Indexing in SQL

- eg.,
create index ssn-index
on STUDENT (ssn)
- or (eg., on *TAKES(ssn,cid, grade)*):
create index sc-index
on TAKES (ssn, c-id)

15-826 Copyright: C. Faloutsos (2017) 35

CMU SCS

Indexing- overview

- B-trees
- (static) Hashing
- extensible hashing
- ➔ – ‘linear’ hashing [Litwin]

15-826 Copyright: C. Faloutsos (2017) 36

CMU SCS

Problem with static hashing

- problem: overflow?
- problem: underflow? (underutilization)

15-826 Copyright: C. Faloutsos (2017) 37

CMU SCS

Solution: Dynamic/extendible hashing

- idea: shrink / expand hash table on demand..
- ..dynamic hashing

Details: how to grow gracefully, on overflow?

Many solutions – simplest: Linear hashing [Litwin]

15-826 Copyright: C. Faloutsos (2017) 38

CMU SCS

Indexing- overview

- B-trees
- Static hashing
- extendible hashing
 - ‘extensible’ hashing [Fagin, Pipenger +]
 - ➔ – ‘linear’ hashing [Litwin]

CMU SCS

Linear hashing - Detailed overview

- Motivation
- main idea
- search algo
- insertion/split algo
- deletion
- performance analysis
- variations

15-826 Copyright: C. Faloutsos (2017) 40

Linear hashing

Motivation: ext. hashing needs directory etc etc; which doubles (ouch!)

Q: can we do something simpler, with smoother growth?

15-826 Copyright: C. Faloutsos (2017) 41

Linear hashing

Motivation: ext. hashing needs directory etc etc; which doubles (ouch!)

Q: can we do something simpler, with smoother growth?

A: split buckets from left to right, **regardless** of which one overflowed (‘crazy’, but it works well!) - Eg.:

15-826 Copyright: C. Faloutsos (2017) 42

Linear hashing

Initially: $h(x) = x \bmod N$ ($N=4$ here)

Assume capacity: 3 records / bucket

Insert key ‘17’

bucket- id 0 1 2 3

4	8	5	9	6	7	11
		13				

15-826 Copyright: C. Faloutsos (2017) 43

Linear hashing

Initially: $h(x) = x \bmod N$ ($N=4$ here)

17 overflow of bucket#1

bucket- id 0 1 2 3

4	8	5	9	6	7	11
		13				

15-826 Copyright: C. Faloutsos (2017) 44

Linear hashing

Initially: $h(x) = x \bmod N$ ($N=4$ here)
 overflow of bucket#1
Split #0, anyway!!!

bucket- id 0 1 2 3

4	8	5	9	6	7	11
		13				

15-826 Copyright: C. Faloutsos (2017) 45

Linear hashing

Initially: $h(x) = x \bmod N$ ($N=4$ here)
 Split #0, anyway!!!
Q: But, how?

bucket- id 0 1 2 3

4	8	5	9	6	7	11
		13				

15-826 Copyright: C. Faloutsos (2017) 46

Linear hashing

A: use two h.f.: $h_0(x) = x \bmod N$
 $h_1(x) = x \bmod (2*N)$

bucket- id 0 1 2 3

4	8	5	9	6	7	11
		13				

15-826 Copyright: C. Faloutsos (2017) 47

Linear hashing - after split:

A: use two h.f.: $h_0(x) = x \bmod N$
 $h_1(x) = x \bmod (2*N)$

bucket- id 0 1 2 3 4

8	5	9	6	7	11	4
		13				

17

15-826 Copyright: C. Faloutsos (2017) 48

CMU SCS

Linear hashing - after split:

A: use two h.f.: $h0(x) = x \bmod N$
 $h1(x) = x \bmod (2*N)$

bucket- id	0	1	2	3	4

CMU SCS

Linear hashing - observations

In general, at any point of time, we have at **most two** h.f. active, of the form:

- $h_n(x) = x \bmod (N * 2^n)$
- $h_{n+1}(x) = x \bmod (N * 2^{n+1})$

(after a full expansion, we have only one h.f.)
